The screenshot shows the 'Web Scraping' interface of the Tariff Analytics application. The left sidebar is identical to the previous screenshot. The main content area is titled 'Web Scraping' and includes a subtitle 'Scrape the local HTML tariff dataset using Requests and BeautifulSoup.' Below this, there is a 'SOURCE' field with the URL 'http://localhost:8000/tariff.html'. A status message indicates '✓ Scraping successful • HTML parsed with BeautifulSoup'. A 'Scrape Dataset' button is present. Below the button, it says 'Records scraped: 1,000'. A table displays the scraped data with columns: S.No, Product Name, Product Type, Brand Name, Price Before Tariff, and Price After Tariff. The table contains 22 rows of data.

Dataset Loaded • 1,000 records

About Project

Tariff Impact Analysis • Python Data Science Mini Project

OBJECTIVE

Analyze product prices before and after tariff and identify patterns across products, categories and brands.

DATASET

Tariff.csv contains 1,000 records and 6 original columns: serial number, product name, product type, brand name, price before tariff and price after tariff.

CALCULATED METRICS

$$\text{Tariff Increase} = \text{Price After} - \text{Price Before}$$
$$\text{Tariff Impact \%} = (\text{Tariff Increase} \div \text{Price Before}) \times 100.$$

TOOLS

NumPy, Pandas, Matplotlib, Seaborn and BeautifulSoup.

APPLICATION STRUCTURE

Dashboard, Product Explorer, Data Analysis, Visualizations, Dataset Comparison, Rankings, Insights Center, Tariff Simulator, Data Cleaning and About Project. Dataset exploration is integrated into Product Explorer.

COMPARISON

If Tariff_2.csv is placed beside this program, the comparison center uses it as Dataset 2. If it is not present, a clearly hypothetical comparison scenario is generated for demonstration.
